Factoring Techniques

Objectives

- 1 Find the greatest common factor of a quadratic expression.
- 2 Factor trinomials in the form $x^2 + bx + c$

3 Factor trinomials in the form $ax^2 + bx + c$

4 Use "reverse engineering" to factor quadratic expressions

The greatest common factor, or GCF, of an expression is the largest term that divides into each term of that expression.

The greatest common factor, or GCF, of an expression is the largest term that divides into each term of that expression.

To find the greatest common factor of an expression:

The greatest common factor, or GCF, of an expression is the largest term that divides into each term of that expression.

To find the greatest common factor of an expression:

• Find the greatest common factor of the coefficients.

The greatest common factor, or GCF, of an expression is the largest term that divides into each term of that expression.

To find the greatest common factor of an expression:

- Find the greatest common factor of the coefficients.
- Select the lowest power of each unique variable.

The greatest common factor, or GCF, of an expression is the largest term that divides into each term of that expression.

To find the greatest common factor of an expression:

- Find the greatest common factor of the coefficients.
- Select the lowest power of each unique variable.

Then divide each term by that GCF.

Factor the GCF from each.

(a)
$$16x^5 + 72x^3 - 36x^2$$

Factor the GCF from each.

(a)
$$16x^5 + 72x^3 - 36x^2$$

GCF of 16, 72, and 36 is 4

Factor the GCF from each.

(a)
$$16x^5 + 72x^3 - 36x^2$$

GCF of 16, 72, and 36 is 4

Lowest power of x is 2, so the GCF of the variables is x^2

Factor the GCF from each.

(a)
$$16x^5 + 72x^3 - 36x^2$$

GCF of 16, 72, and 36 is 4

Lowest power of x is 2, so the GCF of the variables is x^2

GCF is $4x^2$

Factor the GCF from each.

(a)
$$16x^5 + 72x^3 - 36x^2$$

GCF of 16, 72, and 36 is 4

Lowest power of x is 2, so the GCF of the variables is x^2

GCF is $4x^2$

$$4x^2\left(4x^3+18x-9\right)$$

(b)
$$5a^4 + 70a^2 - 25a$$

(b)
$$5a^4 + 70a^2 - 25a$$

GCF of 5, 70, and 25 is 5

(b)
$$5a^4 + 70a^2 - 25a$$

GCF of 5, 70, and 25 is 5

Lowest power of a is 1, so the GCF of the variables is a

(b)
$$5a^4 + 70a^2 - 25a$$

GCF of 5, 70, and 25 is 5

Lowest power of a is 1, so the GCF of the variables is a

GCF is 5a

(b)
$$5a^4 + 70a^2 - 25a$$

GCF of 5, 70, and 25 is 5

Lowest power of a is 1, so the GCF of the variables is a

GCF is 5a

$$5a\left(a^3+14a-5\right)$$

Objectives

1) Find the greatest common factor of a quadratic expression.

2 Factor trinomials in the form $x^2 + bx + c$

3 Factor trinomials in the form $ax^2 + bx + c$

4 Use "reverse engineering" to factor quadratic expressions

$x^{2} + bx + c$

When factoring trinomials in the form $x^2 + bx + c$, we are looking to find 2 numbers that **multiply** to make c and **add** to make b.

$x^2 + bx + c$

When factoring trinomials in the form $x^2 + bx + c$, we are looking to find 2 numbers that **multiply** to make c and **add** to make b.

We can then write the factorization in the form

$$(x+m)(x+n)$$

where mn = c and m + n = b

Factor each completely.

(a)
$$x^2 + 15x + 36$$

Factor each completely.

(a)
$$x^2 + 15x + 36$$

Product of the two numbers is 36.

Factor each completely.

(a)
$$x^2 + 15x + 36$$

Product of the two numbers is 36.

Sum of the two numbers is 15.

Factor each completely.

(a)
$$x^2 + 15x + 36$$

Product of the two numbers is 36.

Sum of the two numbers is 15.

Numbers are 3 and 12

Factor each completely.

(a)
$$x^2 + 15x + 36$$

Product of the two numbers is 36.

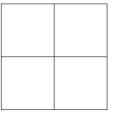

Sum of the two numbers is 15.

Numbers are 3 and 12

$$(x+3)(x+12)$$

$$x^2 + 15x + 36$$

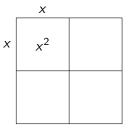

$$x^2 + 15x + 36$$

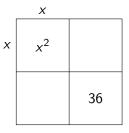

$$x^2 + 15x + 36$$

x^2	

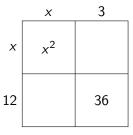

$$x^2 + 15x + 36$$

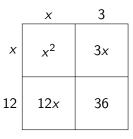

$$x^2 + 15x + 36$$

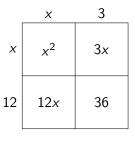

$$x^2 + 15x + 36$$

$$x^2 + 15x + 36$$

$$x^2 + 15x + 36$$

$$(x+3)(x+12)$$

(b)
$$x^2 - 9x + 14$$

(b)
$$x^2 - 9x + 14$$

Product of the two numbers is 14.

(b)
$$x^2 - 9x + 14$$

Product of the two numbers is 14.

Sum of the two numbers is -9.

(b)
$$x^2 - 9x + 14$$

Product of the two numbers is 14.

Sum of the two numbers is -9.

Numbers are -7 and -2

(b)
$$x^2 - 9x + 14$$

Product of the two numbers is 14.

Sum of the two numbers is -9.

Numbers are -7 and -2

$$(x-7)(x-2)$$

(c)
$$x^2 + 5x - 6$$

(c)
$$x^2 + 5x - 6$$

Product of the two numbers is -6.

(c)
$$x^2 + 5x - 6$$

Product of the two numbers is -6.

Sum of the two numbers is 5.

(c)
$$x^2 + 5x - 6$$

Product of the two numbers is -6.

Sum of the two numbers is 5.

Numbers are -1 and 6

(c)
$$x^2 + 5x - 6$$

Product of the two numbers is -6.

Sum of the two numbers is 5.

Numbers are -1 and 6

$$(x-1)(x+6)$$

(d)
$$x^2 - 7x - 8$$

(d)
$$x^2 - 7x - 8$$

Product of the two numbers is -8.

(d)
$$x^2 - 7x - 8$$

Product of the two numbers is -8.

Sum of the two numbers is -7.

(d)
$$x^2 - 7x - 8$$

Product of the two numbers is -8.

Sum of the two numbers is -7.

Numbers are -8 and 1

(d)
$$x^2 - 7x - 8$$

Product of the two numbers is -8.

Sum of the two numbers is -7.

Numbers are -8 and 1

$$(x-8)(x+1)$$

Objectives

1 Find the greatest common factor of a quadratic expression.

2 Factor trinomials in the form $x^2 + bx + c$

3 Factor trinomials in the form $ax^2 + bx + c$

4 Use "reverse engineering" to factor quadratic expressions

$ax^2 + bx + c$

To factor quadratic expressions in the form $ax^2 + bx + c$, we will first transform them into the form $x^2 + bx + c$ by **multiplying** the values of a and c to get:

$ax^2 + bx + c$

To factor quadratic expressions in the form $ax^2 + bx + c$, we will first transform them into the form $x^2 + bx + c$ by **multiplying** the values of a and c to get:

$$x^2 + bx + ac$$

$ax^2 + bx + c$

To factor quadratic expressions in the form $ax^2 + bx + c$, we will first transform them into the form $x^2 + bx + c$ by **multiplying** the values of a and c to get:

$$x^2 + bx + ac$$

We can then factor like in the last example, but we will have to remember to **transform the expression back**; as we will see.

Factor each completely.

(a)
$$3x^2 - 11x - 4$$

Factor each completely.

(a)
$$3x^2 - 11x - 4$$

Multiply a = 3 and c = -4 to get ac = -12.

Factor each completely.

(a)
$$3x^2 - 11x - 4$$

Multiply a = 3 and c = -4 to get ac = -12.

Factor
$$x^2 - 11x - 12$$

Factor each completely.

(a)
$$3x^2 - 11x - 4$$

Multiply a = 3 and c = -4 to get ac = -12.

Factor
$$x^2 - 11x - 12$$

$$(x-12)(x+1)$$

Factor each completely.

(a)
$$3x^2 - 11x - 4$$

Multiply a = 3 and c = -4 to get ac = -12.

Factor
$$x^2 - 11x - 12$$

$$(x-12)(x+1)$$

We are not done yet!!

Example 3
$$3x^2 - 11x - 4$$

$$(x-12)(x+1)$$

$$(x-12)(x+1)$$

Divide the -12 and 1 by 3 and simplify.

$$(x-12)(x+1)$$

Divide the -12 and 1 by 3 and simplify.

$$\left(x - \frac{12}{3}\right) \left(x + \frac{1}{3}\right)$$

$$(x-12)(x+1)$$

Divide the -12 and 1 by 3 and simplify.

$$\left(x - \frac{12}{3}\right)\left(x + \frac{1}{3}\right)$$

$$(x-4)\left(x+\frac{1}{3}\right)$$

$$(x-12)(x+1)$$

Divide the -12 and 1 by 3 and simplify.

$$\left(x - \frac{12}{3}\right) \left(x + \frac{1}{3}\right)$$

$$(x-4)\left(x+\frac{1}{3}\right)$$

Slide any remaining denominators in front of their variable.

$$(x-12)(x+1)$$

Divide the -12 and 1 by 3 and simplify.

$$\left(x - \frac{12}{3}\right) \left(x + \frac{1}{3}\right)$$

$$(x-4)\left(x+\frac{1}{3}\right)$$

Slide any remaining denominators in front of their variable.

$$(x-4)(3x+1)$$

(b)
$$8x^2 + 2x - 3$$

(b)
$$8x^2 + 2x - 3$$

Multiply
$$a = 8$$
 and $c = -3$ to get $ac = -24$

(b)
$$8x^2 + 2x - 3$$

Multiply
$$a = 8$$
 and $c = -3$ to get $ac = -24$

Factor
$$x^2 + 2x - 24$$

(b)
$$8x^2 + 2x - 3$$

Multiply
$$a = 8$$
 and $c = -3$ to get $ac = -24$

Factor
$$x^2 + 2x - 24$$
 $(x+6)(x-4)$

(b)
$$8x^2 + 2x - 3$$

Multiply
$$a = 8$$
 and $c = -3$ to get $ac = -24$

Factor
$$x^2 + 2x - 24$$

$$(x+6)(x-4)$$

$$\left(x + \frac{6}{8}\right) \left(x - \frac{4}{8}\right)$$

(b)
$$8x^2 + 2x - 3$$

Multiply
$$a = 8$$
 and $c = -3$ to get $ac = -24$

Factor
$$x^2 + 2x - 24$$

$$(x+6)(x-4)$$

$$\left(x+\frac{6}{8}\right)\left(x-\frac{4}{8}\right)$$

$$\left(x + \frac{3}{4}\right) \left(x - \frac{1}{2}\right)$$

(b)
$$8x^2 + 2x - 3$$

Multiply
$$a = 8$$
 and $c = -3$ to get $ac = -24$

Factor
$$x^2 + 2x - 24$$

$$(x+6)(x-4)$$

$$\left(x+\frac{6}{8}\right)\left(x-\frac{4}{8}\right)$$

$$\left(x + \frac{3}{4}\right) \left(x - \frac{1}{2}\right)$$

$$(4x+3)(2x-1)$$

(c)
$$16x^2 + 46x + 15$$

(c)
$$16x^2 + 46x + 15$$

Multiply a=16 and c=15 to get ac=240

(c)
$$16x^2 + 46x + 15$$

Multiply
$$a=16$$
 and $c=15$ to get $ac=240$

Factor
$$x^2 + 46x + 240$$

(c)
$$16x^2 + 46x + 15$$

Multiply
$$a = 16$$
 and $c = 15$ to get $ac = 240$

Factor
$$x^2 + 46x + 240$$

$$(x+40)(x+6)$$

(c)
$$16x^2 + 46x + 15$$

Multiply a = 16 and c = 15 to get ac = 240

Factor
$$x^2 + 46x + 240$$

$$(x+40)(x+6)$$

$$\left(x + \frac{40}{16}\right) \left(x + \frac{6}{16}\right)$$

$$\left(x + \frac{5}{2}\right) \left(x + \frac{3}{8}\right)$$

(c)
$$16x^2 + 46x + 15$$

Multiply a = 16 and c = 15 to get ac = 240

Factor
$$x^2 + 46x + 240$$

$$(x+40)(x+6)$$

$$\left(x + \frac{40}{16}\right) \left(x + \frac{6}{16}\right)$$

$$\left(x+\frac{5}{2}\right)\left(x+\frac{3}{8}\right)$$

$$(2x+5)(8x+3)$$

(d)
$$7x^2 - 55x + 42$$

(d)
$$7x^2 - 55x + 42$$

Multiply
$$a = 7$$
 and $c = 42$ to get $ac = 294$

(d)
$$7x^2 - 55x + 42$$

Multiply
$$a = 7$$
 and $c = 42$ to get $ac = 294$

Factor
$$x^2 - 55x + 294$$

(d)
$$7x^2 - 55x + 42$$

Multiply
$$a = 7$$
 and $c = 42$ to get $ac = 294$

Factor
$$x^2 - 55x + 294$$

$$(x-49)(x-6)$$

(d)
$$7x^2 - 55x + 42$$

Multiply a = 7 and c = 42 to get ac = 294

Factor
$$x^2 - 55x + 294$$

$$(x-49)(x-6)$$

$$\left(x - \frac{49}{7}\right) \left(x - \frac{6}{7}\right)$$

$$(x-7)\left(x-\frac{6}{7}\right)$$

(d)
$$7x^2 - 55x + 42$$

Multiply a = 7 and c = 42 to get ac = 294

Factor
$$x^2 - 55x + 294$$

$$(x - 49)(x - 6)$$

$$\left(x - \frac{49}{7}\right)\left(x - \frac{6}{7}\right)$$

$$(x-7)\left(x-\frac{6}{7}\right)$$

$$(x-7)(7x-6)$$

Objectives

1 Find the greatest common factor of a quadratic expression.

2 Factor trinomials in the form $x^2 + bx + c$

3 Factor trinomials in the form $ax^2 + bx + c$

4 Use "reverse engineering" to factor quadratic expressions

You can also use the *x*-intercepts of the graph of the quadratic expression to help you factor.

You can also use the *x*-intercepts of the graph of the quadratic expression to help you factor.

You can also use the x-intercepts of the graph of the quadratic expression to help you factor.

$$x = -6$$
 $x = 1$

You can also use the x-intercepts of the graph of the quadratic expression to help you factor.

$$x = -6$$
 $x = 1$
 $x + 6 = 0$ $x - 1 = 0$

You can also use the x-intercepts of the graph of the quadratic expression to help you factor.

$$x = -6$$
 $x = 1$
 $x + 6 = 0$ $x - 1 = 0$

$$x^2 + 5x - 6$$
 factors as $(x + 6)(x - 1)$

For expressions in the form $ax^2 + bx + c$:

For expressions in the form $ax^2 + bx + c$:

lacktriangledown Get the transformation expression by multiplying a and c.

For expressions in the form $ax^2 + bx + c$:

- lacktriangledown Get the transformation expression by multiplying a and c.
- Find those x-intercepts

For expressions in the form $ax^2 + bx + c$:

- lacktriangledown Get the transformation expression by multiplying a and c.
- Find those x-intercepts
- Transform back by dividing by the value of a and simplifying like in Example 3.

For instance, we transformed $3x^2 - 11x - 4$ to $x^2 - 11x - 12$

For instance, we transformed $3x^2 - 11x - 4$ to $x^2 - 11x - 12$

The x-intercepts of $x^2 - 11x - 12$ are x = -1 and x = 12

For instance, we transformed $3x^2 - 11x - 4$ to $x^2 - 11x - 12$

The x-intercepts of $x^2 - 11x - 12$ are x = -1 and x = 12

Divide each of those by 3 to get $x = -\frac{1}{3}$ and x = 4

For instance, we transformed $3x^2 - 11x - 4$ to $x^2 - 11x - 12$

The x-intercepts of $x^2 - 11x - 12$ are x = -1 and x = 12

Divide each of those by 3 to get $x = -\frac{1}{3}$ and x = 4

Move any remaining denominators in front of their variable:

For instance, we transformed $3x^2 - 11x - 4$ to $x^2 - 11x - 12$

The x-intercepts of $x^2 - 11x - 12$ are x = -1 and x = 12

Divide each of those by 3 to get $x = -\frac{1}{3}$ and x = 4

Move any remaining denominators in front of their variable:

$$3x = -1$$
 and $x = 4$

For instance, we transformed $3x^2 - 11x - 4$ to $x^2 - 11x - 12$

The x-intercepts of $x^2 - 11x - 12$ are x = -1 and x = 12

Divide each of those by 3 to get $x = -\frac{1}{3}$ and x = 4

Move any remaining denominators in front of their variable:

$$3x = -1$$
 and $x = 4$

Get each equal to 0:

For instance, we transformed $3x^2 - 11x - 4$ to $x^2 - 11x - 12$

The x-intercepts of $x^2 - 11x - 12$ are x = -1 and x = 12

Divide each of those by 3 to get $x = -\frac{1}{3}$ and x = 4

Move any remaining denominators in front of their variable:

$$3x = -1$$
 and $x = 4$

Get each equal to 0:

$$3x + 1$$
 and $x - 4$

For instance, we transformed $3x^2 - 11x - 4$ to $x^2 - 11x - 12$

The x-intercepts of $x^2 - 11x - 12$ are x = -1 and x = 12

Divide each of those by 3 to get $x = -\frac{1}{3}$ and x = 4

Move any remaining denominators in front of their variable:

$$3x = -1$$
 and $x = 4$

Get each equal to 0:

$$3x + 1$$
 and $x - 4$

$$(3x+1)(x-4)$$
